

A

Number of records ($\times 10^6$)

C

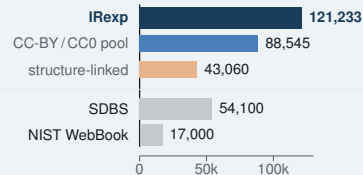

IRexp — what this work adds

- + **Large**
121,233 experimental IR band lists mined from the open literature, released as one bulk corpus
- + **Redistributable**
88,545 records sit in the CC-BY / CC0 pool — commercial reuse without further clearance
- + **Traceable**
source DOI and a per-record licence pool are stamped on every single row

B

Detail: the small end, expanded

Same linear units, 0–130,000 records

SDBS: ca. 54,100 digitised FT-IR absorbance spectra (AIST, 2015). NIST WebBook: ca. 17,000 gas-phase IR (approximate). Grey fills mark view-only interfaces with no bulk export.

NMRexp is the modality peer, holding literature-mined *NMR* peak lists — a different object, not an IR competitor. **IR band lists (cm^{-1} positions) are not absorbance traces.**
